# What is CL\_UD COMPUTING

#### **Table of Content**

- 1) Cloud Computing Introduction
- 2) On premise datacenter vs Cloud Computing
- 3) Cloud Computing Service providers
- 4) Virtualization
- 5) Cloud Computing Service Model
- 6) Cloud Computing Deployment Model

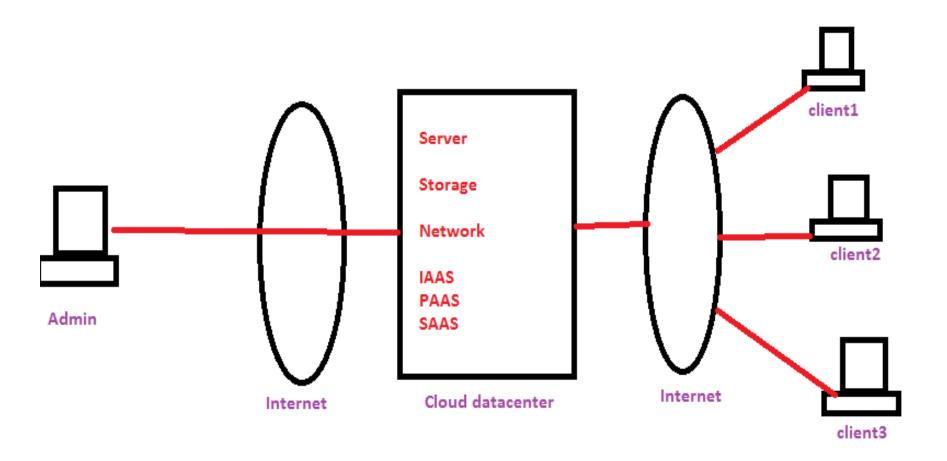

## **What is Cloud Computing**

Cloud Computing is a technology that provides access to various computing resources over the internet.

The practice of using a network of remote servers hosted on the Internet to store, manage, and process data, rather than a local server or a personal computer.

# Types of Server Machines

**Tower Server** 

Rack Server

Blade Server

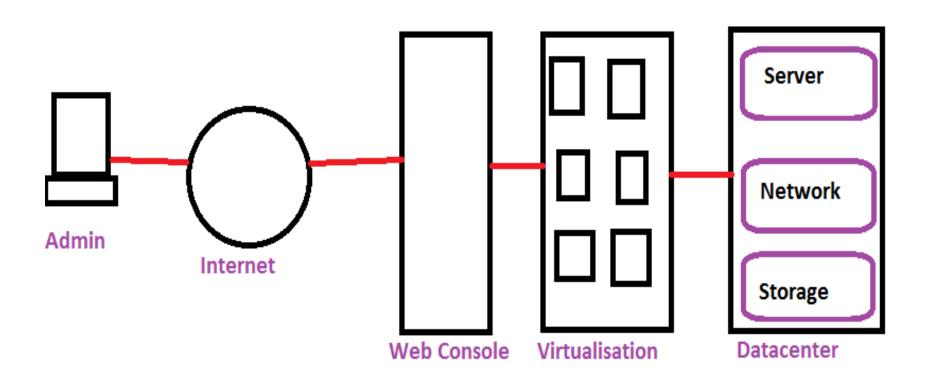

# Storage

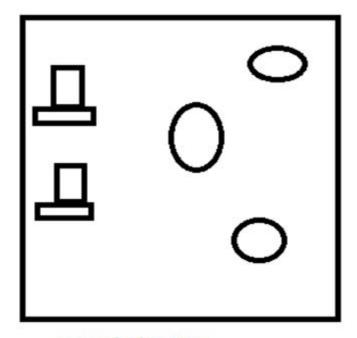

#### Accessing Cloud Datacenter as an admin

#### ON PREMISE DATACENTER

On premise datacenter

- 1) Space
- 2) server machine
- 3) Backup server
- 4) Power -Dual
- 5) Power Backup
- 6) Network-Router, Switches, Cables
- 7) Cooling system
- 8) Maintenance
- 9) Security

etc												
CIC		۰	۰	•	۰	•	•	٠	۰	•	•	•

## Cloud Computing Advantages

#### **Advantages**

- 1) Anytime, Anywhere access
- 2) Cost Saving –No initial investment

Pay based on usage –time and resource

- 3) Flexibility in Capacity
- 4) Automated Updates on Software
- 5)Security Recovery
- 6) Easily Manageable

#### **Cloud Computing Service Providers**

Amazon Web Service (AWS)

Microsoft Azure.

Google Cloud Platform.

IBM Cloud Services.

Salesforce.

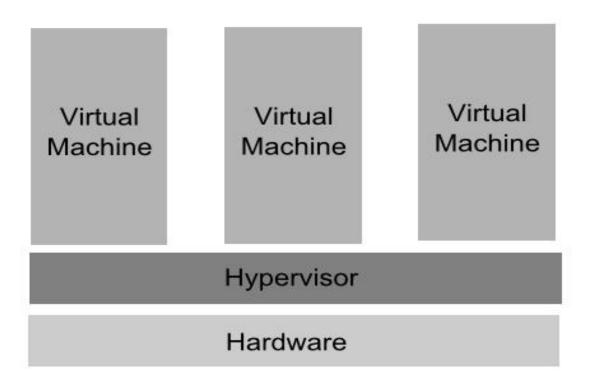

Red Hat

VMware.

Rackspace.....many more

#### Virtualisation

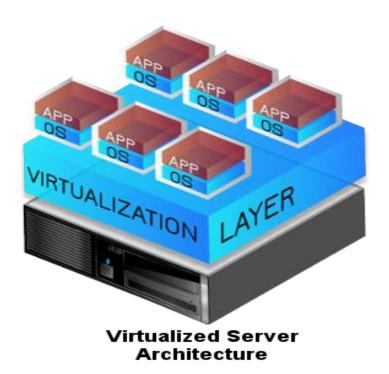

- Virtualization is the creation of a virtual (rather than physical) version of an IT environment, including an operating system (OS), a storage device, etc.
- Virtualization takes place on the same hardware platform after installing specific software - hypervisor

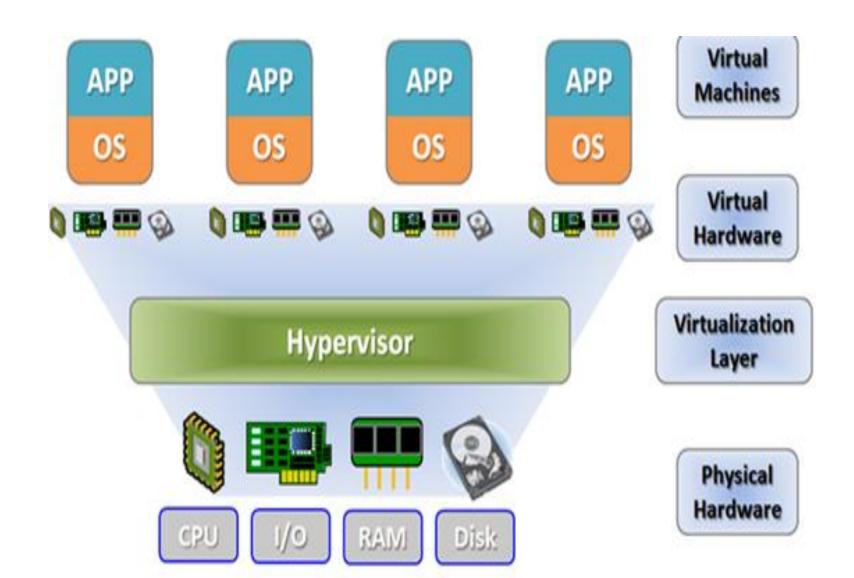

## **How Does Virtualization Work?**

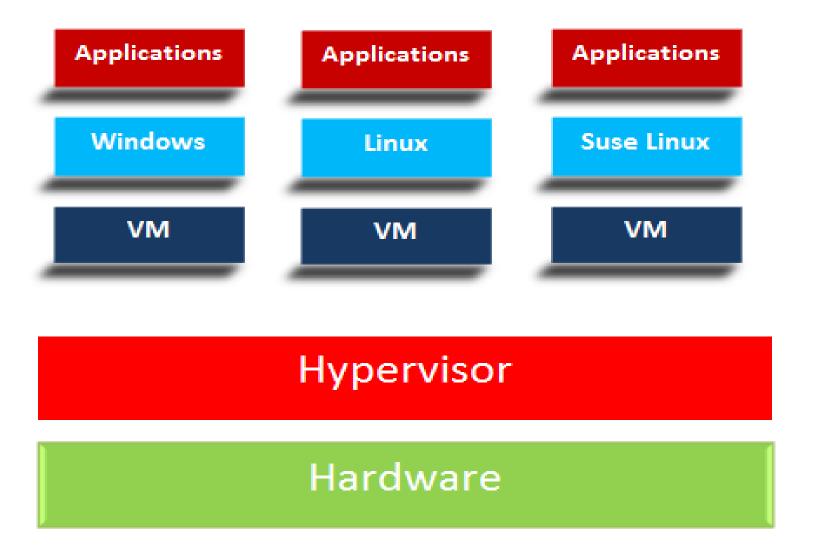

Access to the virtual machine and the host machine or server is facilitated by a software known as Hypervisor. Hypervisor acts as a link between the hardware and the virtual environment and distributes the hardware resources such as CPU usage, memory allotment between the different virtual environments.

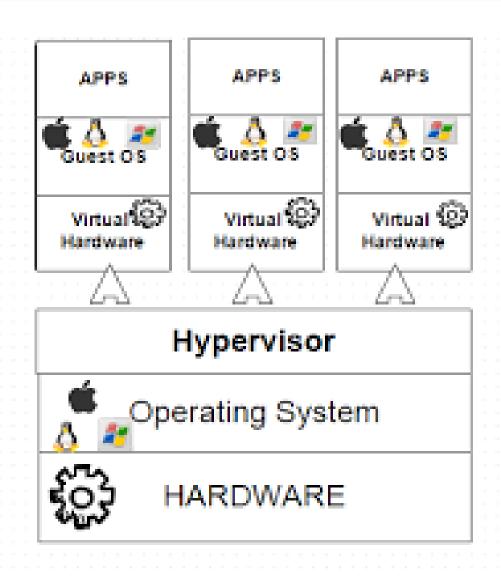

#### **Hypervisor types: Bare metal Hypervisor(Type 1)**

#### **Hypervisor types: Host Based Hypervisor(Type 2)**

#### **Bare metal Hypervisor Softwares**

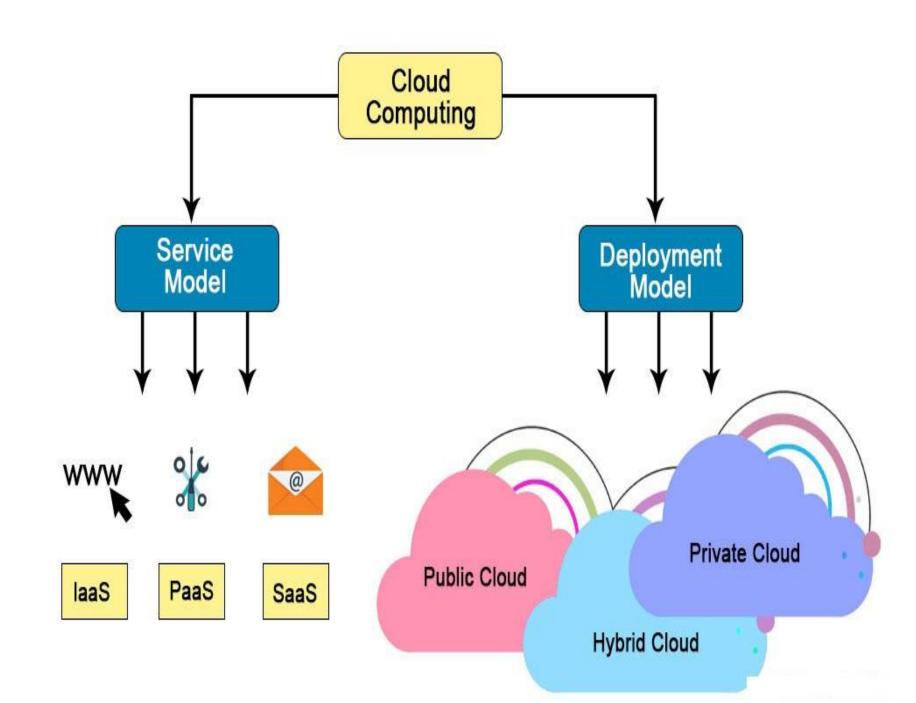

#### **Host Based Hypervisor Softwares**

## **Cloud Services**

#### **Cloud Service Models**

**Packaged Software End Users OS & Application Stack** SaaS Servers Storage Network **Application OS & Application Stack** PaaS Developers Server Storage Network laaS Infrastructure & Server Storage Network **Network Architects** 

# laaS

laaS(Infrastructure as a Service) is the foundational cloud platform layer. This service is used by IT administrators for processing, storage, networks or any other fundamental computer operations. It allows users to run arbitrary software.

# **PaaS**

PaaS( Platform as a Service) is a computing platform which includes an operating system, programming language execution environment, database or web services.

As its name suggests, this platform is provided to the client to develop and deploy software. It allows the client to focus on application development instead of worrying about hardware and infrastructure.

# SaaS

SaaS (Software as a Service) is software which is centrally hosted and managed. It is a single version of the application is used for all customers. You can scale out to multiple instances.

This helps you to ensure the best performance in all locations. The software is licensed through a monthly or annual subscription.

On-site laaS PaaS SaaS **Applications Applications Applications Applications Data** Data Data **Data Runtime Runtime Runtime Runtime** Middleware Middleware Middleware Middleware O/S O/S O/S O/S Virtualization Virtualization Virtualization Virtualization Servers Servers **Servers Servers** Storage **Storage Storage Storage Networking** Networking **Networking** Networking You manage Service provider manages

#### **Public Cloud**

- Services are owned and operated by a third party provider.
- The maintenance is bared by the service provider.
- Pay-as-you-go model.Thus, the setting and operating cost is less.
- Platform is shared.
  - Lesser flexibility & control
- over the cloud environment.

#### **Hybrid Cloud**

- Often called as 'the best of both worlds', it
- of both worlds', it combines both public & private cloud.
  - Greater flexibility &
- more deployment options.
- Cloud bursting is also possible.
- Network complexities & compliance issues.
- Can be extremely expensive.

#### **Private Cloud**

- Dedicated to a single organization.
- Higher security as the resources are not shared.
- Greater flexibility to
   control the cloud
   environment.
  - Purchase and maintenance
- has to be bared by the organization
- Expensive than public cloud.
